

My Specialization Role in GenAI

Core Motivation

I am an impact-focused person. My core motivation to study AI is not money, trends, or hype. It is to build systems that genuinely help people. I want to create AI products that have real-world value, especially in meaningful domains such as healthcare, elderly care, and other high-stakes environments.

For me, the most important thing is responsibility. If an AI system makes a wrong decision and harms someone, that is something I take seriously. I care about the real consequences of AI systems. This is the main reason why I chose to study and specialize in GenAI.

GenAI Architect

What I like:

- Thinking about model strategy (for example: RAG vs fine-tuning)
- Considering technical trade-offs at a high level

What I do not enjoy:

- Infrastructure setup (cloud, deployment pipelines)
- Monitoring, CI/CD, scaling systems for thousands of users
- Compliance-heavy architecture work

Conclusion: Although I understand the importance of system architecture, I do not feel naturally motivated by infrastructure or large-scale deployment responsibilities. Therefore, full Architect does not fit my interests.

GenAI Experience Designer

What I like:

- Understanding user needs
- Planning meaningful UX flows
- Making systems usable and helpful for real people

What I do not enjoy:

- Detailed UI design work
- Crafting tone and microcopy
- Polishing small interface details

Conclusion: I care about users and impact, but I am not driven by interface design or visual experience work. Designer is not the area where I want to develop deep expertise.

GenAI Engineer

What I like:

- Increasing model accuracy
- Reducing wrong decisions
- Experimenting and measuring results
- Debugging model behavior
- Understanding why a model failed

What I do not enjoy:

- API plumbing work
- DevOps-heavy responsibilities
- Infrastructure-focused engineering

The biggest failure for me is when a model makes a wrong decision. System speed or interface issues are important, but model correctness is my highest priority.

Final Conclusion

Based on my reflection, I am not primarily an Architect and not primarily a Designer. My natural depth lies in being a GenAI Engineer, especially focused on model reliability and correctness.

I want to become an impact-driven GenAI Engineer. My goal is to build AI systems that are technically reliable, reduce harmful errors, and can be trusted in real-world high-stakes environments.

My motivation is impact. I express that impact through technical responsibility and improving model reliability. That is the role that fits me best at this stage of my development.
