

Project Comparison Document

StackEval Project (GenAI Engineer)

General Context:

This project provides a clear and structured workflow, including collecting real coding questions, testing multiple LLM models, and evaluating their performance using human scoring. It is practical, step-by-step, and produces measurable results.

It strongly aligns with the GenAI Engineer role because it focuses on experimentation, model evaluation, and understanding model behavior. It is also suitable as a first project since it is concrete and easy to start compared to more abstract projects.

Toys R Us Project (Experience Designer)

General Context:

This project focuses on designing user experiences and improving how users interact with AI systems. It involves understanding user needs, designing interaction flows, and creating meaningful user journeys.

It aligns with the Experience Designer role rather than the GenAI Engineer role, as it focuses more on usability and user interaction rather than model behavior or technical evaluation.

Reclam Bureau Project (GenAI Architect)

General Context:

This project focuses on system-level thinking, including architecture design, data flows, and integration of AI into existing systems. It requires understanding how different components work together at a high level.

It aligns with the GenAI Architect role, as it focuses on system design and structure rather than hands-on model experimentation or evaluation.

Final Comparison and Conclusion

Compared to the other projects, the StackEval project is more suitable because it is clearer, more structured, and directly involves experimentation. It provides measurable outputs and allows hands-on work with LLM models, which aligns strongly with the GenAI Engineer role. For a first project, it is also easier to start and follow.
